

Figure. 30 TAC §112.302(c)(3)(C)(i)(I)

$$GLC_{crit,i} = 0.5 \times (196.4 \mu\text{g}/\text{m}^3 - DV_{AD,i}) - (DV - DV_{AD,i})$$

Where:

$GLC_{crit,i}$ = The value for each receptor i that the modeled concentration in an AMOC demonstration cannot exceed.

$DV_{AD,i}$ = The maximum design value in any modeled scenario approved by the Environmental Protection Agency under 40 Code of Federal Regulations §51.112(a) for receptor i ; and

DV = The design value specified by the Executive Director under this section, which, on the effective date of this section, equals DVA_0 ; and may subsequently be no less than DVA_0 .

DVA_0 = The design value based on the attainment demonstration modeling for the Navarro County SO_2 nonattainment area.
